*For Immediate Release:*

## Mustang Develops Custom End-of-Line Testing Solution for Zero-Turn Mowers

**Twinsburg, Ohio, May 5, 2026:** Mustang Advanced Engineering (MAE), a leader in advanced testing solutions, has designed and implemented a fully integrated end-of-line test station for a major outdoor power equipment manufacturer, improving production efficiency, consistency, and product quality.

As demand increased and product lines expanded, the manufacturer faced challenges maintaining strict quality standards without slowing production. Manual testing created variability, increased operator error, and caused a bottleneck at the end of the line.

MAE developed a custom automated test station for zero-turn mowers, delivering fast, accurate, and repeatable results while integrating seamlessly into production. Key features include automated diagnostic testing, real-time data validation, system integration, operator-friendly design, and laser-based blade measurement.

The solution provides consistent testing across all units, streamlines quality assurance, accelerates product release, and reduces errors and downtime. As a result, every mower is thoroughly tested before leaving the line, improving reliability, efficiency, and overall product confidence.

The implementation of MAE's automated testing solution has delivered immediate and lasting benefits:

- Consistent, automated testing across all units
- Streamlined quality assurance processes
- Faster product release cycles
- Improved reliability and repeatability
- Reduced operator error and minimized production downtime
